

## Plate and Section Shot Blast Machine

Sandstorm 4 Wheel Plate and Section De-Scalers have the capacity to process a wide range of types and sizes of steel and rolled or fabricated steel sections.

Four (4) Sandstorm Speedlock blast wheels are featured on the system, and these can be supplied with either direct drive or vee drive arrangements.

The standard machine can de-scale plate up to 1500mm wide, and rolled section up to 760UB in one pass, and the system may also be designed for larger sections and plate if required.

Conveyor speed of up to 2 linear meters per minute or higher are achievable, depending on each particular application.

An efficient rotary brush/blow off system is used to remove residual abrasive from the product.

The cabinet blast zone is only 600mm wide, overcoming the need for cast rollers within the blast zone, and the system can be supplied with or without external roller conveyors.

Sandstorm can design a combination plate and section machine for all most any application. Contact your local Sandstorm representative for further information.
